Keeping track of innovative testsystems

Reinbek (rie) Many visitors of the international exhibition productronica 2007, held in Munich, came to find out more on up to date and innovative test systems. The exhibition booth of foxfamily test systems, business unit of Tralec GmbH, offered a good opportunity for this, since optifox, a test system for automatic optical inspection (AOI), and pinfox, an electrical tester, were exhibited on productronica 2007.

The interested and specialized visitors could determine at locally accomplished test, the unusual optics of optifox and which outstanding possibilities for evaluation of test data are offered. One indicator for the level of the optifox innovation is the depth of field: 30 mm in the standard configuration. The outstanding depth of field allows examining also mixed mounted boards in high quality optically.

pinfox captivates by "simply intelligent solutions". This modular, flexible inspection system for In-Circuit-Testing (ICT) differs pinfox from other systems clearly. The foxfamily developers of pinfox put much emphasis on the minimization of parasitic tester data and on options to combine a variety of the modules. The new concept pinfox makes electrical testing more exact and faster and the necessary equipment smaller.

Tension-correct measuring eliminates parasitic tester data. The number and the interest of the specialized visitors in foxfamily test systems confirms the Tralec GmbH in their goal of offering optifox and pinfox as two simply intelligent solutions which meet the needs of the market.

Further information to the products foxfamily you can find on the Tralec website www.tralec.de
